

Opening Hook

I've reviewed over 5000 resumes, and I can count on one hand the number of truly great resumes that I've seen. And honestly, yours probably. Isn't that one of them?

Have two giant stacks of paper fall in behind me rotoscoped

But here's the thing. It's not your fault. You've done everything right. Everything that you're supposed to do. But you were following the wrong rules.

Rules that were made five years ago and today do more harm than good.

For instance, we had a client. He had submitted over 300 applications and he heard nothing. Crickets. No interviews. Even though he was basically the perfect candidate.

Have a counter tick up to 300 then flash red, a bunch of crickets show up in the background and maybe say no interviews

And he thought his resume was perfect. He ran it through jobscan. It got a 100, and he optimized it for the ATS system.

Have the job scan logo, and a fake scanning bar then it flashes green and says 100 for the resume below

A GOOD RESUME

ANEMAIL@gmail.com Phone +1 (832) 222 2222 United States

Senior Data Engineer with deep expertise in banking and insurance sectors. Specializes in building scalable cloud data platforms (AWS, Azure, Snowflake) and automating high-volume ELT pipelines. Proven track record of reducing infrastructure costs, minimizing data latency, and enforcing strict governance standards.

EXPERIENCE

COMPANY

Aug 2024 - present

Senior Software Engineer

- Architected micro-batching ELT pipelines using dbt, Apache Spark, and Airflow, establishing 30 minute data freshness.
- Implemented a custom Snowflake 'zero-copy' solution with Apache Iceberg on Azure Data Lake, and Snowflake external stage, ensuring instant data sharing and backward compatibility.
- Enforced data quality and governance using SodaCL and DataHub, integrating automated lineage and RBAC for PII protection with Apache Ranger.
- Automated testing and deployment via Azure DevOps CI/CD pipelines, accelerating delivery cycles.

COMPANY

Feb 2022 - Aug 2024

Data Architect

- Defined the strategic roadmap for deprecating legacy warehouses and migrating to a modern cloud architecture.
- Established an RFC process to standardize data modeling and architectural decisions, improving code quality and reducing technical debt.
- Designed enterprise-wide observability patterns to monitor platform health and user adoption.
- Standardized data warehouse integration patterns, streamlining collaboration with business intelligence teams.

COMPANY

Sep 2017 - Jul 2021

Principal Software Engineer

- Led the remediation of 38 critical cyber vulnerabilities across 2 ASVs in two months.
- Built ETL pipelines using Python, PySpark, and AWS EMR, and microservices with Django and AWS ECS.
- Received 'Run the Engine' award for significant technical debt reduction and process improvements.

TECHNICAL SKILLS

- **Cloud & Infrastructure:** AWS (EMR, S3, ECS), Azure (Data Lake, DevOps), Terraform, Docker
- **Modern Data Stack:** Snowflake, dbt, SQL, Apache Iceberg
- **Big Data & Streaming:** Apache Spark, Python, Kafka
- **Orchestration & Quality:** Airflow, SodaCL, DataHub, Great Expectations
- **Leadership:** Technical Leadership, Team Mentorship, Agile/Scrum
- **Language Skills:** English (Native Speaker), Spanish (Native Speaker)

EDUCATION

Texas A&M University

Aug 2012 - May 2017

Bachelor of Science in Computer Engineering

my team took it and we fixed five key things. And then after two weeks he got 19 interviews, one of which led to his second job.

So here are the five rules that you can follow to build a resume that actually gets interviews.

Have a cool loading screen that shows the 5 rules greyed out as you always do so well.
And let's start with the worst problem of them all.

Rule 1: Its not that damn phone, its the ATS

Again loading screens for each section

There is a pervasive lie. You've probably heard it over and over again. And actually I have spread it myself. Sorry.

it involves three letters. ATS. You've heard of it and you're probably optimizing around it.

Show those letters big in white

But now that I own a recruiting company, I can see behind the curtain.

Have that great jumpseat logo animation you created.

And I got access to all the major ATS that companies use.

Have logos for greenhouse, workday, iCIMS, Ashby

And they're not what most people think they are.

There is no Terminator like robot that's hunting down your resume and killing your application.

Think there is a fun thing we can do here

The only thing that actually kills your application

are the initial questions. The radio button type questions in the beginning of an application.

Show on screen a question "Are you authorized to work in the US?" with radio button yes or no. Then have a mouse pointer come on screen and click No then have that terminator ATS robot come out and slice the application in half or something

For instance, are you authorized to work in the US? Do you need a visa?

How many years of experience do you have?

Those questions will generally get you screened out, but if you make it past those questions.

There's no scanning system that is judging you and killing your application. It doesn't exist, at least not yet.

What is actually happening is a slightly advanced keyword matching system.

what? A hiring manager sets up a job. They have specific criteria that they're looking for. And essentially the ATS just gives you a grade. His grades show up at the top and the lowest at the bottom.

Have a resume get scanned then its given a B+ and it goes into a list of applications that is graded. A+ at top. F at bottom.

And if you've sent out a couple hundred applications and you haven't heard back, your resume is probably bad.

But the good thing is we can fix it.

For starters, we need to think of our resume as a marketing document.

You have one page, maybe two, to sell yourself to a potential job.

Meaning that every single character counts.

Particularly at the top of your resume.

and when people only think about the ATS system

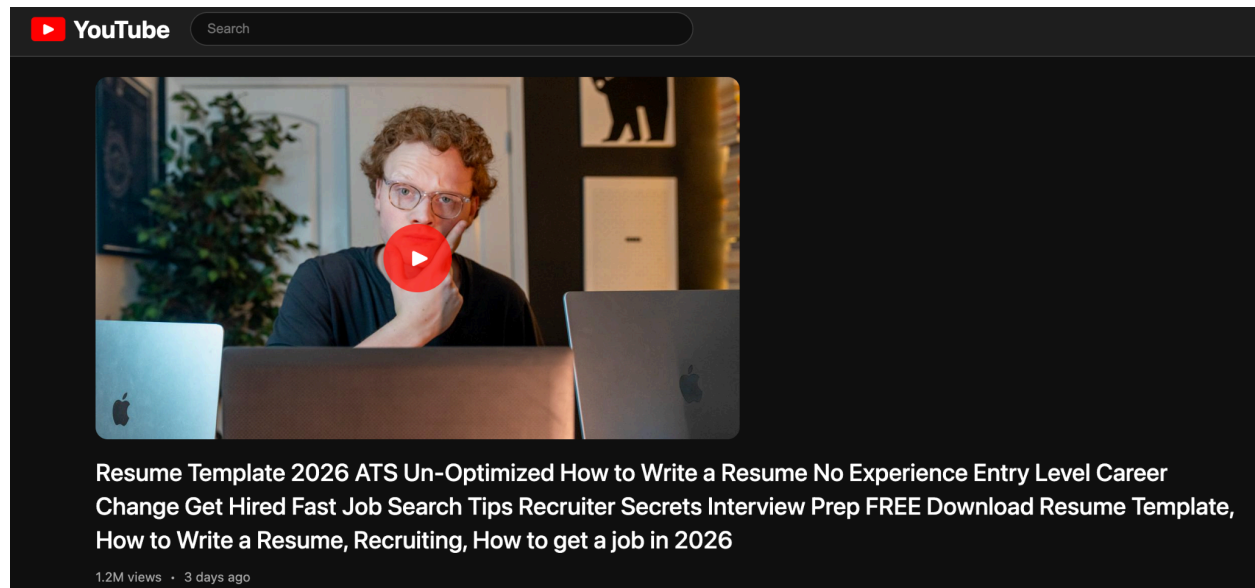

and over optimizing for keywords, you end up getting things like this.

Summary

Proficient QA Automation Engineer with 9 years of experience in end-to-end software testing for mainframe and web applications across UI, databases, and APIs. Expertise in Agile and Waterfall environments with a strong understanding of SDLC and STLC. Skilled in building robust Cucumber (BDD), JUnit, and Page Object Model frameworks using Java, Selenium WebDriver, and TestNG. Adept in integrating relational databases with automation frameworks, API testing using REST Assured, and conducting accessibility (ADA/508) and performance testing with JMeter and BlazeMeter. Experienced in AI-based test automation with ACCELQ and delivering efficient regression and functional testing solutions.

if you were hiring for a job, you open up someone's resume and that's what you see. Would you keep reading?

It's there equivalent of me making a youtube title like this

And the main issue is a human will read your resume. A prerequisite for you to get interviewed is that a human will go through it.

In the main issue. The thing that we forget is that a human will read your resume. It is a prerequisite for you getting an interview that a human with their two eyeballs will scan over the document.

and when they see this straight to the bin.

Have the straight to jail meme on screen

And this goes for the whole resume. We are not keyword spamming anymore because it makes the resume entirely unreadable.

Sure, it may rank high on a job scan, but it ranks very low in terms of human readability.

Show a jobscan highly rated resume

That doesn't mean that we're not going to add keywords. There's just more tactical ways that we're going to go about doing it. And we'll talk about that in a second.

for now, we need to make sure that hiring managers are actually making it into the meat of your resume. We can do that with a very simple tactic.

Rule 2: Spoonfeed the three things

So when a recruiter opens your resume, they are looking for three things.

Show this on screen somehow

1. Years of experience
2. Main job titles
3. Skills

how many years of experience do you have?

what were the main job titles that you had in the past? And three,

what are your skills?

Now a good resume will have all of those things, but it create resume will front load them.

Show this resume below and highlight the Job experience title and dates, then the skills section skills and job titles. Then morph it into the resume template in the frame and zoom in onto the summary section at the top

Then show the below resume and zoom in on the summary line below the email and linkedin

WILSON WYE

Email | NYC | LinkedIn

Product Manager (8+ Years) specializing in enterprise fintech and scaling data pipelines.

WORK EXPERIENCE

Company #1

June 2025 – Present

Product Owner / Scrum Master

Remote

Leads product development and roadmap for a \$15m ARR enterprise accounts payable software.

- Modernized billing and regulatory reporting workflows, replacing legacy end-of-day reconciliation with near real-time data pipelines supporting month-end billing and compliance requirements.
- Implemented a Snowflake zero-clone architecture using Apache Iceberg on Azure Data Lake, enabling backward compatibility, seamless data transitions, and instant data sharing.
 - **Tech Stack:** Python, Snowflake, Terraform, SQL, AWS, Azure DevOps, Colibra

Merrill Lynch

May 2020 - July 2025

Project Manager | June 2023 - July 2025

Remote

- As a Business Analyst, I used Jira and agile methodologies to manage our backlog, write stories and synthesize feedback from 6+ stakeholder groups to shape our feature roadmap.
- Designed an ML-based hourly sales forecasting model in partnership with the analytics team that replaced a manual daily process, delivering automated net sales predictions to EVPs every hour.
- Migrated process from Excel and Microsoft access to Alteryx which saved 1.5 hours daily across our team and allowed reports to be generated error-free in one click.
 - **Key Results:** Revived a historically underperforming team increasing sprint delivery **from 47 points to 71 points** through improved communication, documentation and scrum ceremonies.

Project Manager | April 2022 - June 2023

- Prior to my promotion, I worked on the Auto Loans team which processed 10M+ loans.
 - **Key Result:** Codified manual quarterly risk reporting into a high-performance Spark pipeline, reducing processing time by 99%**(from 1 month to 4 hours)**.

Bank of America

June 2019 - September 2019

Business Analyst Intern

Pennington, NJ

- Selected for *BoA Big BoI Program*, training the top .5% of interns in leadership and industry finance.

SKILLS

- **Tools:** Jira, SQL, Tableau, Power BI, Azure DevOps, Confluence, Sharepoint, Microsoft Visio+Project, HTML/CSS, Adobe Premiere, Lightroom, Photoshop
- **Skills:** Business Agile, Project Management, Story Writing, Backlog Management, Public Speaking
- **For Fun:** Competitive Ping-pong. If they are interested Interviewers will ask about it.

EDUCATION

Syracuse University

Sep 2016 - May 2020

Bachelor of Science

Syracuse, NY

- **GPA: 3.82/4.0;** Double Major: Information Management and Technology(IM&T), Finance
 - IM&T Specializations: Project Management and Web Design
- Graduated top 10% while co-founding a startup and playing on the club tennis team.

And you could do that very simply with the summary section.

It is the most powerful part of the resume. And if done correctly, it will make it hard for hiring manager not to continue on reading it.

Now remember, on average a human will look at your resume for seven seconds. And the only thing that we can guarantee that they will read is the top.

So at the top we want one to two sentences. That spoon feeds them all the information that they are looking for.

Show these examples while I am talking

Data Engineer(4+ years) specializing in Snowflake, dbt, Python and ML-Driven Pipelines.

Senior Manager (12 years) specializing in data optimization and process automation.

Senior Financial Analyst (7+ years) specializing in FP&A, Process Automation and Financial Modeling.

This is not the place to pack in keywords. Don't overdo it. Nobody is a specialist at nine things.

Keep it simple. We want everything they want and nothing they don't.

And an easy way to do that is through tailoring our resume, which doesn't have to be an hour long ordeal can take a minute or less, which we'll go through in rule number five.

CTA BREAK

And by the way, I'm starting a new content series Roasting People's Resumes. And as a token of thanks, if you give me your resume to roast, I will give you the resume template that we've used for all of our clients.

Check it out.

Maybe show the website pleaseroastmyresume.com the step 1, 2 and 3. And maybe photoshop in a frame from the video instead of it being a blank video in the slot like it has now

Rule 3: CONTEXT

Moving down the resume after the summary section, we want to go right into our job experience. Education does not go at the top unless you are a recent grad, and that is the most important thing.

Show the major resume and highlight the summary section then move the highlight down to the experience section

I have included in the documents my resume template.

Now, again, a prerequisite for getting an interview is that a human will read your resume.

But a lot of us, when we write our experiences,

there is no context. We're using acronyms.

Highlight all the Acronyms in red and put red question marks around them

Company: CNB

Date: 05/2019 - Current

Position: SDET

- Created a Framework (Java/Selenium/JDBC/Restful library) from scratch that is **BDD and DDT**.
- Applied OOP concepts of **Java** (Encapsulation, Abstraction, Polymorphism, Inheritance) with Base Class and Common Methods to the framework for more reusable, maintainable and easy to read tests.

And it all assumes that the reader knows what the company does that you work for. They know the acronyms

and they know what the team within the business actually did. We can't assume any of that.

Because you know what assumptions make.

An ass out of you and me.

Have the word assume on screen

Then break it into three sections ASS U ME

For instance, entries like this.

Senior Financial Analyst – Financial Planning & Analysis

Harbor Freight Tools

May 2022 – Present

Calabasas, California (Remote)

- Led process improvements in forecasting models, reporting, and dashboards to accommodate business growth, resulting in enhanced KPI monitoring and more insightful value-added analysis
- Produced and distributed comprehensive financial reports on a weekly, monthly, and annual basis to executives and senior management, facilitating informed decision-making and strategic planning
- Ensured the timely completion of multiple functional area budgets within established deadlines, achieving 100% compliance with financial planning timelines and enhancing overall budget management

And basically, we forget the bigger picture. We need to frame this experience as to why it would be important and how it is relevant for

this future job that we are trying to get.

So what we have found immense success with.

Was a single line that summarizes the job that we did and why it's important.

Show the same screenshot as above but then have it morph into this

And highlight the first line the "Owns forecasting..."

Harbor Freight

Senior Financial Analyst (Financial Planning & Analysis)

May 2022 - Present

Remote

Owns forecasting, budgeting and modeling across four functional areas for a 1,600+ retail store network.

- Designed an ML-based hourly sales forecasting model in partnership with the analytics team that replaced a manual daily process, delivering automated net sales predictions to EVPs every hour.
- Drove the finance requirement for migrating the reporting stack from Oracle to Databricks which enabled automated job scheduling and error-free report delivery.
- Reviews and approves 350+ CapEx requests annually while leading monthly P&L reviews with leaders.

so under every experience before going in the bullet points of the nitty gritty of what we did, we give a high level overview.

While I am speaking for the next part show these examples then again show the whole thing for a second then zoom in and highlight the summary section the first line before the bullet points.

Arthur J. Gallagher & Co.

Actuarial Wealth Analyst

January 2024 - Present

Remote

Built and maintained the Excel-based financial models that drive actuarial projections and client deliverables.

- Re-engineered legacy workbooks into template-driven models that auto-adjust to annual data structure changes, eliminating multi-hour manual updates.
- Owned end-to-end analytical workflows supporting long-term liability estimates and benefit projections for client engagements worth \$10B+ in assets.
- Translated complex actuarial outputs into clear documentation used in both internal reviews and client-facing presentations.
- Mentored new analysts and interns on modeling standards and analytical processes, accelerating their ramp to independent contributor status.
 - **Key Result:** Automated calculation and validation across recurring analyses, reducing multi-hour updates to seconds while reducing error rates.

Moloco

Senior Manager, Business Analytics

July 2022 - April 2023

Remote

Hired to build business reporting infrastructure for a Series C ML-powered advertising platform.

- Led a cross-functional data migration that unified HubSpot, Salesforce, and internal databases into a single integrated system allowing for growth across new verticals.
- Created the company's first metrics dictionary, establishing a shared language across teams that made the migration possible and ensured reporting consistency post-launch.
- Delivered a clean, unified dataset that enabled error-free reporting and gave leadership visibility into performance across business lines for the first time.

Zynga*Senior Manager, Business Operations & Analytics***October 2017 - March 2021***San Francisco, CA*

Led ad monetization strategy and data optimization for a \$250M mobile game advertising portfolio.

- Inherited a data operations process where 40–50 vendor reporting sources were manually compiled in Excel, riddled with errors, unparsable, and 2 days behind.
- Hired and managed an offshore team in India to compile overnight reporting, cutting data delivery from 2 days of unreliable spreadsheets to 8 hours of clean, actionable data.

Who are you working for?

What is it doing? How big is the team? What product is it?

Basically, we want to fill the gaps and get rid of any assumptions that people have before reading onto what we actually did.

and then want to hire managers reading through the bullet points, they can actually paint a picture in their head because they have the context.

Basically, we are making it easy for someone to read the resume.

And again, another way we make it easy is by not keyword spamming.

But the problem is that we still need keywords.

The ATS system isn't killing our application, but if we're ranking at the bottom because we didn't use any keywords, our application might not get seen.

So what we can do is use **keyword farms**.

Delete the words Keyword farm and just cut to loading screen

Rule 4: Keyword Farms

I kinda want the background to look like stardew valley on this loading screen. Like 20% opacity in the background

Instead of writing bullet points like this or summary sections like this.

Company: CNB**Date: 05/2019 - Current****Position: SDET**

- Created a Framework (Java/Selenium/JDBC/Restful library) from scratch that is **BDD and DDT**.
- Applied OOP concepts of **Java** (Encapsulation, Abstraction, Polymorphism, Inheritance) with Base Class and Common Methods to the framework for more reusable, maintainable and easy to read tests.

Summary

Proficient QA Automation Engineer with 9 years of experience in end-to-end software testing for mainframe and web applications across UI, databases, and APIs. Expertise in Agile and Waterfall environments with a strong understanding of SDLC and STLC. Skilled in building robust Cucumber (BDD), JUnit, and Page Object Model frameworks using Java, Selenium WebDriver, and TestNG. Adept in integrating relational databases with automation frameworks, API testing using REST Assured, and conducting accessibility (ADA/508) and performance testing with JMeter and BlazeMeter. Experienced in AI-based test automation with ACCELQ and delivering efficient regression and functional testing solutions.

Instead, we're going to have intentional places where we have keywords that

don't interrupt the flow of the resume.

for instance, for tech roles, we love to add a tech stack

Show this below resume piece then zoom in and highlight the tech stack.

City National Bank

Software Development Engineer In Test(SDET)

May 2019- Present

Remote

Hired as the first QA engineer in the payments organization and built the entire automation framework and team.

- Designs and maintains a hybrid automation framework using Java, Selenium, and Cucumber (BDD) that serves as the foundation for all testing across mobile, web, and API layers.
- Integrated automated test suites into CI/CD pipeline using Jenkins, cutting regression cycles from days to hours.
- Conducted performance and load testing using JMeter, identifying bottlenecks before they reached production.
- Created framework documentation, onboarding guides, and trained new QA team members, reducing ramp-up time for incoming engineers.
- Led testing for a FreedomPay payment integration that resolved a 6-month outage where Apple Pay and Google Pay transactions were failing to process.
 - **Tech Stack:** Java, Selenium, Cucumber, JDBC, Restful, Page Object Model, Maven, Postman, ACCELQ

as the bottom bullet point, which just lays out every system that you used

Then show alternate versions

Texas Capital Bank

Data Architect | Aug, 2023 – July, 2024

July 2021 - July 2024

Remote

Promoted to Data Architect to lead a larger modernization of the legacy data warehouses.

- Defined the enterprise roadmap for migrating to a standardized cloud-native architecture.
- Established an RFC-driven architecture governance process, creating clear decision ownership and reducing ad hoc design variance and technical debt.
- Standardized data modeling, integration, and warehouse patterns across teams, accelerating delivery and improving collaboration with BI and analytics stakeholders.
- Acted as the main escalation point for cross-team data initiatives, ensuring alignment with long-term platform strategy.
 - **Tech Stack:** Python, Snowflake, Terraform, SQL, AWS, Azure DevOps, Collibra

so that you don't need to cram in four of them into each bullet point.

and if it's not a tech specific role then we tend to use key results. And this is basically just pulling out whatever the most important thing we did.

- Led testing for a FreedomPay payment integration that resolved a 6-month outage where Apple Pay and Google Pay transactions were failing to process.
 - **Key Result:** Automated the creation of 5,000 test user profiles in a single day for loan credibility testing, a process that previously took a team 7-10 days to complete manually.

basically how can we quantify at the work that we did. Did it save time? Did it make money? Did we win an award?

Throughout the next few sentences that I talk about show examples of the key results.

Geico

Master Data Engineer

July 2024 – Present

Remote

- Modernized billing and regulatory reporting workflows, replacing legacy end-of-day reconciliation with near real-time data pipelines supporting month-end billing and compliance requirements.
- Designed and implemented a Snowflake zero-clone architecture using Apache Iceberg on Azure Data Lake, enabling backward compatibility, seamless data transitions, and instant data sharing without disrupting legacy consumers.
- Enforced enterprise-grade data governance and security by enforcing automated data quality, lineage, and RBAC controls via SodaCL, DataHub, and Apache Ranger, while automating CI/CD pipelines to improve deployment speed and reliability.
 - **Key Result:** Reduced billing data latency from **6+ hours to near real time** by designing micro-batch and streaming ETL pipelines using Fink, Spark and Airflow.

- **Key Results:** Reduced ingestion complexity ~80% while enabling training-ready datasets for ML workflows and analytics consumed by Reality Labs Sales.

- **Key Result:** Generated \$13M/Yr in additional revenue from a problem no one knew existed.

- **Key Result:** Awarded Special Recognition and promoted for the Alteryx process improvement.

now these alone can make people read more of your bullet points if they see the key result, they're interested in it.

then maybe they want to take through the bullet points a little bit more.

now, another thing we do is breaking up the skill section into multiple parts, instead of it just being one gigantic paragraph.

We can have 3 or 4 different sections that can capture all of the different keywords that might be needed.

or that we might have missed.

And also, when we're setting up a resume like this, it makes it easier to tailor the resume.

because we're confining all the things that we need to change per job into very specific places,

meaning instead of having a catch all resume where we need to rewrite the entire thing for each job, we can just rewrite three specific sections.

Rule 5: Tailor your clothes, and your resume.

We know resume tailoring is important. If you don't, it is. I'm not going to beat that dog with a dead horse.

Have a loading spinner on my head and the error loading noise. Then have a video of a man walking with a horse held in his hand above his head about to swing it on a dog(intentionally really dumb)

Loading...

But I think most people go about it in the wrong way. If it takes you more than two minutes to tailor your resume, you're doing something wrong.

Because the name of the game really when we are applying nowadays is volume.

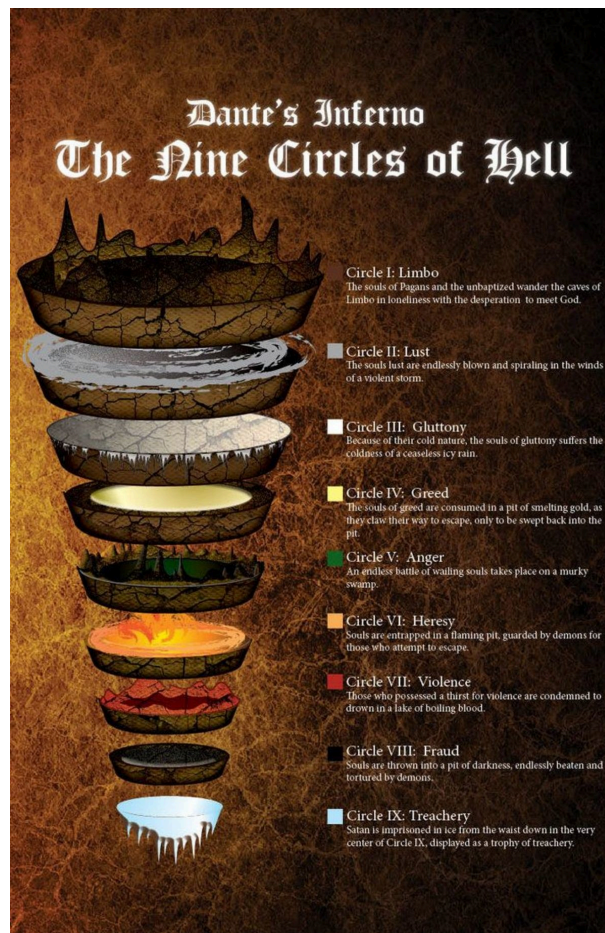

Getting as many applications out the door as possible.

Because when every job has 500 people who applied to it, you can go one of two ways one, you can work your network. You can build a personal connection with the hiring manager, and that will give you a greater chance of landing the job.

But let's be honest, you don't talk to anyone. And networking is.

A special level of hell.

Can we have a picture of dantes inferno. It needs to say “The nine circles of hell” then cross of nine and write ten. And add a level that says “networking” and make sure that the background actually matches our theme. Black. I think we can take all of the discs from this picture and the title, we dont need all the text on the right. Just add one layer on the top

And even if you are prosocial, you're going out to all these networking dinners. It's kind of like dating.

You want to meet someone in the wild? Have your meet cute story that you can tell all your family members. But how many people do you actually talk to?

I can take a guess.

Zoom in on my face and the number zero.

So if we're not going to go the networking route, then we need to up the volume.

Can we have a volume nob that is turned up. Dont actually up the volume though

I'm going to say this until the day I die to get a job. Nowadays we should be targeting a thousand applications.

It's absurd, I know, but you can make it easier by optimizing for one thing, not the ATS system.

The TPA. You've heard it here first. The time per apply.

Have big on the screen TPA

If it takes you 15 minutes to send each application.

We're talking about 250 hours to get a job.

Big 250 hours on screen

Good luck doing that. While working your 9 to 5.

the gold standard for our suppliers within our company is two minutes per application.

And that includes tailoring the resume. So how do we do it again targeting three specific sections.

Here we can use that one third element on the left that can have three sections that show up as I say them.

The main thing is the summary section. We tweak the job title and then the primary skills based on the job description.

And after that we're tweaking our keyword farms,

whether that be the tech stack, if it's a tech job or the skill section.

we remove the ones that aren't in the job description. Then we're adding in the ones that are.

And then number three, maybe we tweak the job titles.

if it is synonymous to the one that was used in the job description, for instance, software developer or software engineer.

Marketing analyst. Marketing coordinator.

Again, it's a marketing document.

if it is functionally the same job, just tweak the job title.

Now if all this sounds like too much for you, and you rather just sit back and have interviews delivered straight to your calendar.

Check out [Jumpseatjobs.com](https://jumpseatjobs.com). We're a reverse recruiting service that sends applications on your behalf. They're not AI applications. I've tested all the major AI players and they're all dogshit.

Show the website

Now, if you were to do one thing from this video

reread your resume. Would a human actually want to read it?

Stop optimizing for robots. Because hiring is human.

Have text optimizing for robots in white. Then cross it off with a red line and below it then have the text. Hiring is human
